Resilience of Redcare proven in a live fibre based environment

“We installed the Redcare system at the Muswell Hill FTTC facility and robust checks were completed. The tests were 100% successful.”

Gary Yam,
Director, Woodside Security Systems Limited

Woodside Security Systems Limited has confirmed the resilience of the Redcare portfolio, in a live Fibre to the Cabinet (FTTC) environment.

Gary Yam, Director at Woodside Security Systems says, “We installed the Redcare system at the Muswell Hill FTTC facility and robust checks were completed. The tests were 100% successful.”

The external testing completed by Woodside Security Systems, in addition to the Beta testing that Redcare had already undertaken, reinforces the compatibility of all Redcare products, including Redcare GSM, in an FTTC environment.

FTTC will be used to provide advanced IP based services such as very high speed broadband. This will be customer driven, meaning customers will be able to make a choice over whether they have broadband delivered over copper or fibre, depending on the service they want. Fibre will be deployed from the exchange to the street cabinet in parallel to existing copper which will remain to support services such as PSTN, ISDN and traditional Redcare products.

Woodside Security Systems use Redcare in their day to day work, primarily specifying Redcare Classic. Gary continues, “Redcare Classic is known for its reliability and at Grade 4, provides the highest level of protection for our customers.”

Woodside Security Systems, based in East Finchley, supply and install intruder alarms and other security systems. The two directors have 45 years of experience in electronic security and they work with a mix of commercial and domestic customers.

Redcare Classic:

- Most widely used Grade 4 system in the UK
- Redcare network has over 99.997% availability
- Compliant with British and European standards for Grade 4 alarm signalling
- Redcare technology notifies of line cuts or faults in 40 seconds
